

POISONING & UNIVERSAL ANTIDOTE.

Many children accidentally absorb poison, yet few parents know of this simple universal antidote that you should always keep on hand.

FORMULA:

2 parts of wood charcoal pulverised (you can also use burned toast, but the toast must be totally carbonized & pulverised)

Then add 1 part of magnesia milk & 1 part of very strong tea.

If your child has swallowed a toxic product, feed him as FAST as you can in a little bit of water at least 2 table spoons of this mixture.

How does it work: If the poison is metallic or alkaline, the tannic acid contained in the tea will neutralise it. If the poison is acid, the magnesia will neutralise it. The wood charcoal, even at very little dose, can absorb very strong quantities of toxins.

When you have given the antidote & called doctor, then;

- 1: Discover the nature of the poison. Keep the bottle or the box so that the doctor can quickly identify it.
- 2: Except in case where the child had taken soap or some alkaline presenting burns around the mouth, make him vomit.

To do this; the best procedure is to give him a glass of milk in which you have mixed a full broken egg (no shell). When he has drunk this mixture, thrust one finger in his throat.

- 3: Give him another antidote mixture dose.

Act quickly, as some toxins can bring death in 5 min. Usually the doctor is not equipped to treat poisoning at home, so after having used the Universal Antidote, bring the child to the nearest hospital.
